## Voorwoord

Dit rapport is gemaakt in opdracht van Rijkswaterstaat Centrale Informatievoorziening (CIV). In het kader van de Monitoring Waterstaatkundige Toestand des Lands (MWTL) worden jaarlijks in diverse Nederlandse wateren planktonmonsters verzameld. Het betreft zowel zoete als zoute oppervlaktewateren.

Het voor u liggende rapport geeft een overzicht van het verloop van de soortensamenstelling en dichtheid van het fytoplankton in de kustwateren in het Nederlandse deel van de Noordzee in 2016. De analyses zijn uitgevoerd door Koeman en Bijkerk bv, in het kader van de Raamovereenkomst Hydrobiologie, zaaknummer 31072166.0010.

De bemonstering is uitgevoerd door de meetdiensten van Rijkswaterstaat. De monsters zijn geanalyseerd tussen 17 juni 2016 en 13 april 2017, door ing. R.M. van Wezel en A. van den Oever BSc. R.M. van Wezel controleerde de databestanden en was verantwoordelijk voor de digitale aanlevering van de analyseresultaten aan Rijkswaterstaat CIV in een voor opslag in EcoLims geschikt formaat. Tevens stelde hij de digitale basisrapportage en de voorliggende schriftelijke eindrapportage samen.

De inhoudelijke begeleiding vanuit Rijkswaterstaat berustte bij Dr. F. Kouwets. Binnen Koeman en Bijkerk was ing. R.M. van Wezel verantwoordelijk voor de projectleiding.

Haren, 6 juli 2017

R.M. van Wezel  
A. van den Oever

# 1 Inleiding

## 1.1 Achtergrond

In het kader van het biologisch meetnet van het programma Monitoring Waterstaatkundige Toestand des Lands (MWTL) heeft Rijkswaterstaat tussen april en oktober van 2016 één tot twee keer per maand planktonmonsters verzameld op veertig meetpunten in de Nederlandse zoute wateren. Dit betreffen locaties in de Noordzee, de Waddenzee (inclusief het Eems/Dollard estuarium) en het Deltagebied.

Het monitoringsonderzoek fytoplankton omvat drie onderdelen:

- 1) een analyse van met zure Lugol gepreserveerde monsters voor een kwantitatieve beschrijving van de soortensamenstelling en dichtheid van fytoplankton gedurende het meetseizoen;
- 2) een analyse van met zure Lugol gepreserveerde monsters voor een kwantitatieve beschrijving van de dichtheid van *Phaeocystis* gedurende het meetseizoen;
- 3) een analyse van met alkalische Lugol gepreserveerde monsters voor een bepaling van de soortensamenstelling en dichtheid van coccolithoforen.

Dit rapport is het zevenentwintigste sinds de start van het biologisch monitoringsprogramma zoute wateren in 1990 (Koeman *et al.* 1991, 1992, 1993; TRIPOS 1994, 1995, 1996, 1997, 1998, 1999; AquaSense 2000; Koeman *et al.* 2002a, 2002b, 2003, 2004, 2005, 2006, 2007, 2008, 2009a, 2010; Mulderij *et al.* 2011, 2012, 2013; van Wezel *et al.* 2014, 2015, 2016). Met ingang van het meetjaar 2013 is de rapportage van de monitoring gesplitst in een digitale basisrapportage en een schriftelijke eindrapportage. Vanaf het meetjaar 2015 worden de monsters van de meeste Noordzeelocaties alleen op *Phaeocystis* geanalyseerd; aan de overige monsters (Delta, Waddenzee en overgangswateren) wordt nog wel een integrale fytoplanktontelling uitgevoerd. In de digitale basisrapportage worden de ontwikkelingen in de concentraties van *Phaeocystis* en chlorofyl-a gedurende het gerapporteerde meetjaar beschreven en verwerkt in trendgrafieken over de gehele monitoringperiode. Deze basisrapportage bevat ook de EKR-scores voor het KRW kwaliteitselement zoutwater fytoplankton. De voorliggende schriftelijke eindrapportage beschrijft de gebruikte methodologie, behandelt opvallende waarnemingen en nieuwe taxa, en geeft een tabulair overzicht van de analyseresultaten.

## 1.2 Doel

Het informeren van Rijkswaterstaat CIV over de soortensamenstelling en dichtheid van het fytoplankton in de verzamelde monsters.

### 1.3 Opzet

Alle werkzaamheden binnen deze opdracht zijn uitgevoerd volgens procedures die zijn vastgelegd in ons kwaliteitszorgsysteem volgens NEN-EN-ISO/IEC 17025:2005. Koeman en Bijkerk is geaccrediteerd onder nummer [L573](#). In ons laboratorium zijn de fytoplanktonmonsters geanalyseerd onder accreditatie.

### 1.4 Leeswijzer

In dit eindrapport worden de resultaten gepresenteerd van de analyse van de in 2016 genomen fytoplanktonmonsters in de zoute rijkswateren en de overgangswateren. De rapportage is opgesteld volgens het rapportageprotocol van RWS CIV (i.80.11, versie 3, d.d. 7 september 2015). Hoofdstuk 2 geeft een beschrijving van de gehanteerde methode van analyse en gegevensverwerking. De belangrijkste resultaten worden behandeld in hoofdstuk 3. In hoofdstuk 4 wordt een overzicht van de gebruikte literatuur gegeven. Alle analyseresultaten zijn opgenomen in de bijlagen als ook digitaal aangeleverd.

## 2 Materiaal en methoden

### 2.1 Onderzochte monsters

De bemonstering en conservering van de monsters zijn uitgevoerd door de opdrachtgever. De monsters bestaan uit ongeconcentreerd water uit de zoute rijkswateren, gepreserveerd met aangezuurde of basische Lugol (voor fytoplankton respectievelijk coccolithoforen) en opgeslagen in glazen flessen met een volume van 1 liter. De flessen zijn voorzien van een etiket waarop het labinfosnummer, de locatie en de (geplande) datum van bemonstering zijn vermeld. In het laboratorium van Koeman en Bijkerk zijn deze monsters bij ontvangst gecontroleerd op de staat van conservering, ingevoerd in ons laboratorium-informatiesysteem en vervolgens donker en koel (3-5 °C) bewaard tot aan verdere behandeling. Bijlage I geeft de codering en herkomst van de geanalyseerde monsters voor de telling van fytoplankton, *Phaeocystis* en coccolithoforen, met de datum van bemonstering en analyse.

Er zijn in 2016 in totaal 440 monsters van in totaal veertig locaties aangeleverd voor analyse. Hiervan zijn 162 monsters van met name Noordzeelocaties alleen geanalyseerd op *Phaeocystis*.

Voor de coccolithoforenanalyse zijn in 2016 dertien monsters aangeleverd van de locatie TERSCHELLING 135. Omdat de verkalkte schaaltes van de coccolithoforen oplossen in de reguliere monsters (met aangezuurde lugol), worden hiervoor monsters genomen die met basische lugol worden gepreserveerd.

### 2.2 Algemene methodiek

De analyse van de monsters is uitgevoerd in overeenstemming met de werkvoorschriften MET-001, versie 4 en ALG-022, versie 1. Deze werkvoorschriften volgen de voorschriften van de opdrachtgever (RWS A2.108, versie 3). Als aanvullende methode is bij een deel van de monsters calcofluorkleuring toegepast voor identificatie van thecate dinoflagellaten, met name voor de potentieel toxische dinoflagellaten van het geslacht *Alexandrium*. De analyse van *Phaeocystis* in de Noordzeemonsters volgt dezelfde methodiek, met dien verstande dat dit taxon in de eerste twee subsamples van de analyse geteld wordt. De detectielimiet ligt hierbij in alle gevallen minstens een factor 10 lager dan de drempelwaarden voor *Phaeocystis* die binnen de Kaderrichtlijn Water gebruikt worden voor een ecologische beoordeling.

### 2.3 Determinatie en naamgeving

Er is gestreefd naar determinatie tot op soortniveau, voor zover mogelijk bij de gebruikte preservatie, zonder speciale technieken of uitgebreid literatuuronderzoek (met uitzondering van *Alexandrium* spp.; zie paragraaf 2.2). Wanneer een taxon niet tot op soortniveau gedetermineerd kon worden, is op het eerstvolgende hogere taxonomische

niveau gerapporteerd. Voor de determinaties is gebruik gemaakt van de publicaties vermeld in hoofdstuk 4 en van publicaties gekoppeld aan de TWN-lijst.

De laboratoriumtellijsten zijn gekoppeld aan de geannoteerde soortenlijst (Brochard *et al.* 2013). Door veranderende inzichten in taxonomie en naamgebruik vertonen de tellijsten verschillen met de hier opgeleverde naamgeving volgens TWN. Bijlage II geeft een kruistabel tussen de geannoteerde soortenlijst FP-zout en de hier gerapporteerde taxa.

## 2.4 Gegevensverzameling en gegevensverwerking

Bij de fytoplanktonanalyse zijn de volgende gegevens verzameld:

- labinfosnummer;
- locatiecode;
- bemonsteringsdatum;
- naam van de aangetroffen alg;
- aantal waargenomen eenheden (losse cel, kolonie) per onderscheiden taxon;
- aantal getelde cellen per onderscheiden taxon;
- volume van het monster dat voor de telling onderzocht is.

Uit het aantal getelde cellen en de grootte en het percentage van het onderzochte volume, is met behulp van een omrekeningsfactor de oorspronkelijke dichtheid per onderscheiden taxon in cellen per liter berekend. De betrouwbaarheid van de dichtheidsbepaling is gekwantificeerd als de geëxpandeerde meetonzekerheid, afgeleid uit de fouten in de deelmonsternamen, het pipetteren, de bepaling van de cuvetfractie en uit de verdeling van deeltjes in het cuvet. Deze meetonzekerheid is berekend als 20,9% bij tweehonderd waarnemingen (Bijkerk *et al.* 2012).

De verzamelde gegevens zijn verwerkt tot een Excelbestand. Een uitdraai van de databestanden, in aangepast formaat volgens het rapportageprotocol van RWS CIV (i.80.11), is opgenomen in de bijlagen III-V van dit eindrapport, voor fytoplankton-, *Phaeocystis*- en coccolithoforenanalyse respectievelijk. Daarbij zijn de monsters gesorteerd op locatiecode en bemonsteringsdatum.

De analyseresultaten van alle Noordzeemonsters voor wat betreft *Phaeocystis* zijn opgenomen in Bijlage IV. Enkele series Noordzeemonsters zijn volledig geanalyseerd voor fytoplankton ten behoeve van de Moneos- en Jerico-programma's; deze zijn tevens als uitgebreide analyse opgenomen in Bijlage III.

## 3 Resultaten

### 3.1 Algemeen

#### 3.1.1 Fytoplankton

In zeven van de 278 fytoplanktonmonsters is het minimum aantal waarnemingen van honderd niet gehaald (Tabel 1). Dit betrof vaak monsters met een grote hoeveelheid slib, zoals die uit de Waddenzee, de Eems-Dollard en de Westerschelde, of monsters met een lage dichtheid fytoplankton, zoals Oosterscheldemonsters die vroeg of laat in het seizoen zijn genomen.

**Tabel 1** Fytoplanktonmonsters waarbij het minimum aantal (100) waarnemingen (Wn) niet behaald is.

| LIMScore   | Locatiecode | Product code | Monster datum | Wn |
|------------|-------------|--------------|---------------|----|
| 2016005353 | WESTZN      | LN.3         | 29-6-2016     | 88 |
| 2016002652 | LODSGT      | OW           | 1-3-2016      | 88 |
| 2016002858 | BOCHTWWTM   | OW           | 17-3-2016     | 87 |
| 2016002747 | HANSWGL     | OW           | 7-3-2016      | 79 |
| 2016003249 | SCHAARVODDL | OW           | 5-4-2016      | 60 |
| 2016002859 | GROOTGND    | OW           | 17-3-2016     | 58 |
| 2016007588 | ZIJPE       | OW           | 12-9-2016     | 56 |

#### 3.1.2 Phaeocystis

In 2016 zijn 77 monsters aangetroffen met een totaalgehalte aan *Phaeocystis* (flagellaat + cel) van boven de  $10^6$  cellen per liter. Daarvan hadden 26 monsters een gehalte van boven de  $10^7$  cellen per liter (zie Tabel 2). De monsters waren ruwweg gelijk verdeeld over de Noordzee- en de overige locaties. Zoals gewoonlijk viel de piek in het voorjaar, maar ook in augustus werden nog enkele malen monsters aangetroffen met meer dan  $10^6$  cellen per liter.

**Tabel 2** Fytoplanktonmonsters met een totale concentratie van meer dan  $10^6$  *Phaeocystis*-cellen per liter, gesorteerd in aflopende concentratie.

| LIMScore   | Locatiecode | Product code | Monster datum | Concentratie <i>Phaeocystis</i> (cel/l) |
|------------|-------------|--------------|---------------|-----------------------------------------|
| 2016003355 | GOERE2      | OW           | 14-4-2016     | 55.136.765                              |

### 3.1.3 Coccolithoforen

In de coccolithoforenmonsters op locatie TERSCHELLING135 zijn de hoogste aantallen gemeten gedurende de zomermaanden. Zoals gewoonlijk is *Emiliana huxleyi* de meest algemene soort (zie Bijlage V). In een enkel monster kwam echter een massale bloei van

*Braarudosphaera bigelowii* voor, met een concentratie van 115.000 cellen per liter. Zie voor verder informatie paragraaf 3.4.2

### 3.2 Aanvullende technieken

#### 3.2.1 Calcofluorkleuring voor thecate dinoflagellaten

Het pantser van thecate dinoflagellaten kan aangekleurd worden met de fluorescente kleurstof Calcofluor White (ook wel bekend staand als *fluorescent brightener*, FB). De opheldering van de plaatstructuur is vaak noodzakelijk voor een correcte identificatie. Bij Koeman en Bijkerk wordt deze kleuring met name gebruikt ter verificatie van het toxische dinoflagellaatgeslacht *Alexandrium*.

In het verleden werd *Alexandrium* voornamelijk aangetroffen op de Terschelling-raai. Voor RWS worden de meeste Noordzeemonsters alleen nog maar geanalyseerd op *Phaeocystis*, zodat er in het monitoringjaar 2016 voor wat betreft de telling van *Alexandrium* slechts een enkel monster is behandeld met Calcofluor White (monsternummer 2016003353, locatie WALCHEREN70, 14 april 2016)

### 3.3 Aanpassingen naamgeving

Voor de oplevering van de data is de naamgeving van de taxa geconformeerd aan de actuele TWN-lijst, waarbij gekozen is voor een status 10. Zie Bijlage II voor een kruistabel tussen de taxa in de geannoteerde soortenlijst en de hier gerapporteerde soorten.

In 2015 is een geharmoniseerde dataset opgeleverd van alle fytoplanktondata van de meetjaren 2000-2014. Deze dataset was opgezet in het LIMS-format van RWS-CIV. Ten opzichte van die dataset, zijn voor het meetjaar 2016 geen aanpassingen aan de naamgeving gedaan.

### 3.4 Opvallende waarnemingen

#### 3.4.1 *Pseudochattonella*

In de meeste april monsters van het Deltagebied van 2016 werd *Pseudochattonella* aangetroffen. Een enkel monster bevatte van deze soort een zeer hoge dichtheid van  $12 \times 10^6$  cellen per liter (monsternummer 2016003595, locatie DREISCHOR, bemonsteringsdatum 25 april 2016). De cellen in dit monster zien er niet in heel goede staat uit, de bloei lijkt daarom al over zijn hoogtepunt heen, zie Figuur 1.

**Figuur 1** Typische *Pseudochattonella*-cellen uit een massale bloei op locatie DREISCHOR van 25 april 2016. Cellengte: 20 µm.

*Pseudochattonella* is een wereldwijd voorkomend geslacht, dat in de Nederlandse wateren zowel in het Deltagebied, als in de Noord- en Waddenzee voorkomt. Het kan makkelijk verward worden met Raphidophyceae vanwege de grote aantallen kleine chloroplasten en mucocysten; het taxon behoort echter tot de silicoflagellaten. De slijmafscheiding van de mucocysten van deze alg kan leiden tot irritatie van het kieuwweefsel van vissen, en dit wordt als mogelijke verklaring gegeven voor de ichtyotoxiciteit die dit geslacht ten toon stelt (Eckford-Soper & Daugbjerg 2016). Een ondergrens van 10.000 cellen per liter is vastgesteld voor vissterfte van Chinookzalm in Nieuw Zeeland door *Pseudochattonella verruculosa* (MacKenzie *et al.*, 2011). Deze soort komt ook in Nederlandse wateren voor.

Tabel 3 geeft een opsomming van gebeurtenissen waarbij de dichtheid van *Pseudochattonella* deze ondergrens van 10.000 cellen per liter overschreden heeft, sinds dit taxon in 2009 als aparte entiteit is geteld.

**Tabel 3** Fytoplanktonmonsters uit de periode 2009-2016 met een totale concentratie van meer dan 10.000 *Pseudochattonella*-cellen per liter, gesorteerd in aflopende concentratie.

| LIMScode   | Locatiecode | Product code | Monster datum | Concentratie <i>Pseudochattonella</i> (cel/l) |

### 3.4.2 *Braarudosphaera bigelowii*, Prymnesiales

In het monster 2016005031 (locatie TERSCHELLING 135, 15 juni 2016) is een gecombineerde bloei van *Braarudosphaera bigelowii* en *Chrysochromulina* (s.l.) aangetroffen (Figuur 2), met 115.000 en 1.662.000 c/l respectievelijk. Hoge concentraties aan kleine (3-5 µm) *Chrysochromulina*-soorten zijn niet uitzonderlijk, maar wel van grotere taxa. Vergelijkbare bloeien van dit taxon worden als potentieel toxisch gemeld langs de kust van Denemarken en Canada (Lassus *et al.* 2016). Ook bloeien van *Braarudosphaera* in deze dichtheden komen zelden voor.

Nog uitzonderlijker hierbij is de celinhoud, die in alle cellen van dit monster zeer goed zichtbaar is, met duidelijk te onderscheiden celorganellen (Figuur 3).

**Figuur 2** Een enkele *Braarudosphaera bigelowii* cel en twee *Chrysochromulina* cellen uit het Monster 2016005031 (TERSCHELLING 135, 15 juni 2016) met een bloei van *Braarudosphaera bigelowii* (bovenste cel) en *Chrysochromulina* (de twee langwerpige cellen met een lengte van 9 µm).

*Braarudosphaera* is een haptofyte alg met een zeer regelmatig pantser van calciëtplaten (kalkschaaltjes). Vanwege die eigenschap werd deze soort in het verleden geschaard onder de coccolithoforen. Niettemin was het een vreemde eend in de bijt: de kalkschaaltjes hebben een unieke structuur in vergelijking met andere coccolithoforen. En vanwege de afwezigheid van een opening in de coccosfeer werd eerder al gesuggereerd dat het mogelijk een cyst betrof (Heimdal in Tomas 1997). Dat dit taxon inderdaad niet binnen de 'echte' coccolithoforen valt, werd recentelijk bevestigd met behulp van fylogenetische analyse, waarbij de soort gelinkt is aan de niet-coccolithofoor *Chrysochromulina parkeae* (Thompson *et al.* 2012, Hagino *et al.* 2013).

*Braarudosphaera* wordt in het algemeen aangetroffen met een wat vage, gekleurde inhoud, waarin celorganellen niet herkenbaar zijn. Echter, in dit monster is de celinhoud zeer goed zichtbaar, en celorganellen duidelijk te onderscheiden. Daarbij bevat het monster een hoge dichtheid aan *Chrysochromulina parkeae*-achtige vormen, die wat betreft celarchitectuur, sterk lijken op de cellen die ingekapseld zijn in de calciëtplaten. Wij beschouwen dit daarom als levensstadium tussen de naakte (*Chrysochromulina*) vorm en het coccolithofoor stadium.

Overigens moet hierbij opgemerkt worden dat hier de naam *Chrysochromulina* taxonomisch gezien niet houdbaar is, en dat dit taxon in de toekomst zeker afgesplitst zal worden.

**Figuur 3** Cellen van *Braarudosphaera bigelowii* zijn bedekt met karakteristieke vijf-hoekige calciëten. Monster 2016005031, gepreserveerd met alkalische Lugol. Locatie TERSCHELLING 135, 15 juni 2016. Doorfocusering van een enkele cel. Beeldbreedte is 25 µm; de diameter van de cel met platen is 12 µm.

### 3.5 Nieuwe taxa

Tijdens het meetjaar 2016 is een enkel taxon opgenomen in de geannoteerde soortenlijst FP-zout: *Attheya decora*. Alhoewel de soort al wel bekend was van Nederlandse wateren, is hij voorheen vanwege zijn sporadische voorkomen nog niet eerder geteld in de Lugolmonsters.

| Naam         | <i>Attheya decora</i> (Fout! Verwijzingsbron niet gevonden.)                                                                                              |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Beschrijver  | West 1860.                                                                                                                                                |
| Tellijsten   | Vanaf 2016 opgenomen in de telling.                                                                                                                       |
| Beschrijving | Cylindrische, enigszins platgedrukte cel met 4 stompe hoornen op de hoekpunten. Solitair. Talrijke gordelbanden zijn zichtbaar.                           |
| Ecologie     | Polyhalien, litoraal-pelagisch (van der Werff & Huls 1957-1974).                                                                                          |

## Bijlage II      Kruistabel geannoteerde soortenlijst naar TWN

Alleen de in meetjaar 2016 aangetroffen taxa zijn hier vermeld en gerapporteerd volgens de TWN-naamgeving (d.d. 27 april 2017); KenB-naamgeving volgt de geannoteerde soortenlijst FP-zout.

| KenB-naam                      | TWN-naam        | TWN-kenmerk                      |
|--------------------------------|-----------------|----------------------------------|
| Achnanthes longipes            |                 |                                  |
| Actinocyclus normanii          |                 |                                  |
| Actinocyclus octonarius        |                 |                                  |
| Actinoptychus senarius         |                 |                                  |
| Actinoptychus splendens        |                 |                                  |
| Akashiwo sanguinea             |                 |                                  |
| Alexandrium tamarense          |                 |                                  |
| Amphidinium                    | Amphidinium [1] |                                  |
| Amphora                        | Amphora [1]     |                                  |

## Bijlage V      Analyseresultaten coccolithoforen per locatie en datum

### Toelichting

|           |                                                                             |
|-----------|-----------------------------------------------------------------------------|
| Taxonnaam | taxonnaam volgens TWN-lijst (d.d. 27 april 2017)                            |
| Kenmerk   | toevoegingen met betrekking tot stadium of specificering van onbekende taxa |
| cel       | aantal getelde cellen                                                       |
| obs       | aantal waarnemingen                                                         |
| ml        | monstervolume dat voor het betreffende taxon is geanalyseerd                |
| cel/l     | berekende aantal cellen per liter                                           |

| Taxonnaam                                                                                                                       | Kenmerk | cel | obs | ml      | cel/l   |
